

Stage 3 - Low-Fidelity Wireframes

Amazon India | Unified exception resolution | Review artifact

These wireframes show the proposed customer flow, not final visual design. The MVP combines one exception

Design questions for review

- Does the exception banner make the problem clear without blaming the customer?
- Is the next action more prominent than the raw event history?
- Should high-value or deadline-sensitive orders show human escalation earlier?
- Does the recovery choice expose enough policy and refund detail to build trust?

Screen 1 - Order exception banner

Surface the problem immediately from the existing order page.

Key decision: make the exception visible before the customer has to search for help.

Screen 2 - Unified exception timeline

Combine customer-facing event history, confidence, ownership, and next update.

Key decision: show a customer-readable state model, not raw operational events.

Screen 3 - Recovery options

Offer a bounded choice with eligibility, timing, and consequences visible.

Key decision: recovery choices must show the customer-facing outcome, not just an action label.

Screen 4 - Resolution status

Close the loop with confirmed outcome, refund details, and feedback.

Key decision: distinguish refund initiation from bank settlement so the experience does not promise completion too early.
